Storage Resources in Cloud Datacenters

- Cloud computing allows sharing of resource at the cost of reduced isolation.
- Storage systems are highly sensitive to performance interference.
- ► Lack of performance isolation → Unpredictable latencies.

A Cloud Scenario

- In worst case, a particular HTTP request may require 35 database lookups.¹
 - Response time can add up quickly.
- Amazon reported 100ms of latency cost them 1% in sales.²
- Google found an extra .5 seconds delay caused 20% drop in search traffic.²

Performance Isolation

- Clients want to have performance guarantees in the shared environment.
- Possible solutions to performance isolation.
 - Dedicated resources.
 - Meet clients' response time requirements in the shared environment.
 - We represent response time requirements with request deadlines.
 - Meeting request deadlines \rightarrow Performance isolation.

MicroFuge

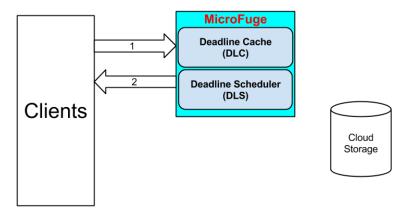

- A distributed caching and scheduling middleware that provides performance isolation.
 - Deadline Cache (DLC)
 - Builds a performance model of the system.
 - Uses multiple LRU queues for deadline-aware eviction.
 - Deadline Scheduler (DLS)
 - Performs intelligent replica selection.
 - Implements feedback-driven deadline-aware scheduling.
 - Optionally performs admission control.
- Middleware: supports different cloud storage systems.

DLC - Benefits

- Multiple LRU queues enable DLC to perform deadline-aware evictions.
- Adaptive policy considers both the client request rate for each deadline range and the underlying system's performance.
- DLC offers adaptive deadline-aware caching.

DLS - Benefits

- Deadline-aware load-balancing.
- A variant of earliest deadline first scheduling.
- Tunable admission control system.

Experimental Setup - The Cluster

Conclusion

- Predictable performance is necessary in multi-tenant environments.
- MicroFuge tackles the performance isolation problem with its deadline-aware caching and scheduling middleware.
- ► MicroFuge reduces deadline miss rate from 17.5% to 7.7% and it can be as low as 4.7% if we turn on the admission control.

Thank You.

DLS - Admission Control

- Bound the fraction of requests that miss their deadlines.
- Requests are rejected in two situations.
 - The request will be miss its own deadline.
 - The new request will cause already accepted requests to miss their deadlines.
- Provides a system parameter β as a knob to control the percentage of deadline misses.
